The bachelor thesis - Effect of Mineral Scaling on Geothermal wells done for the course Applied Earth Sciences was done under the supervision of Prof. Phil Vardon and Prof. Denis Voskov in the summer period. During my eight-week work, I got a better explaining and understand of the subject which I was dealing with and gave me a huge inside of how does a problem like scaling can cause much damage to the injection and the production well.

During my thesis, I struggled a lot times in order to get my simulation to be right and that taught me to never give up no matter how big the problem is. It also gave me an idea that sometimes life can be hard but its just for some time and it will get better soon. I really appreciate the way my supervisors advised me with all the necessary steps and got me into understanding this problem in much detail. Doing a thesis in the topic when sustainable energy use is increasing in order to avoid harm to planet made my dream come closer of living a sustainable life.

Moreover, I am grateful to my study counsellor Mr. Pascal de Smidt who helped me in my tough time in order to finalize my thesis. Finally, I am also thankful to the administration team who were highly supportive of my decisions and let me do my thesis in Q5.
